DASHBOARD

This kit helps you come up with a dashboard ui for your appgini application

You can make further changes to fit your project needs.

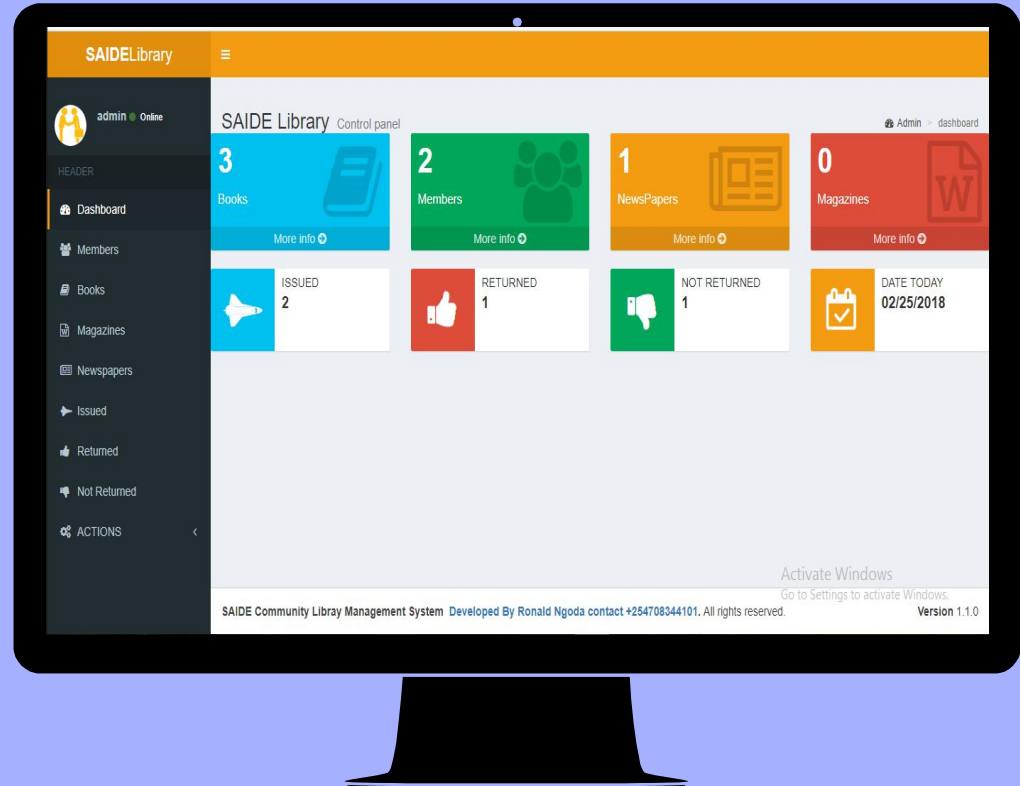

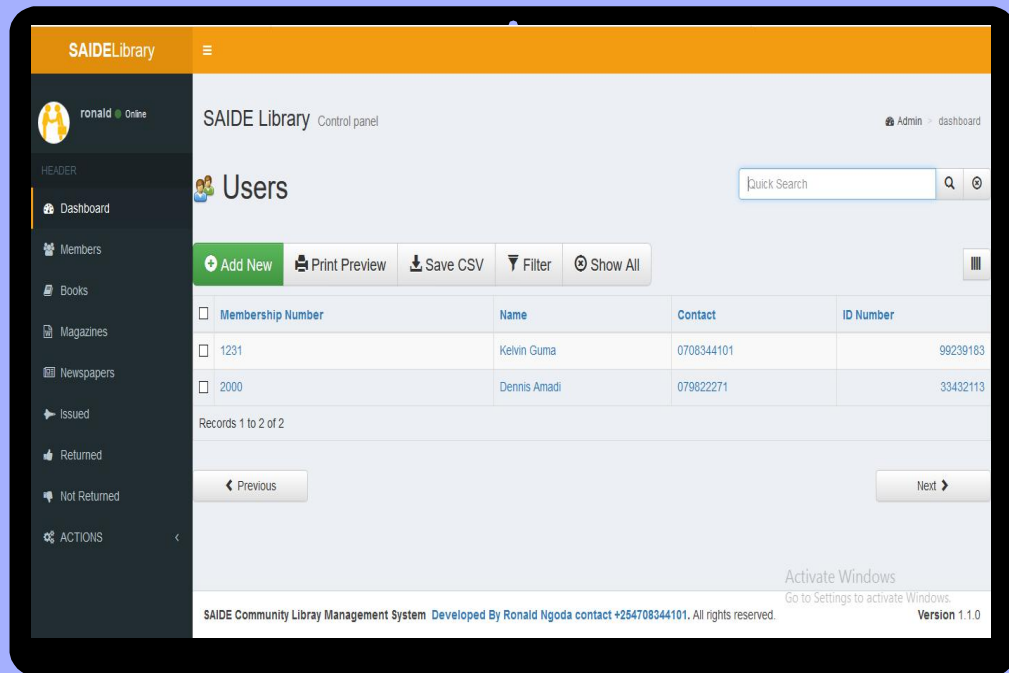

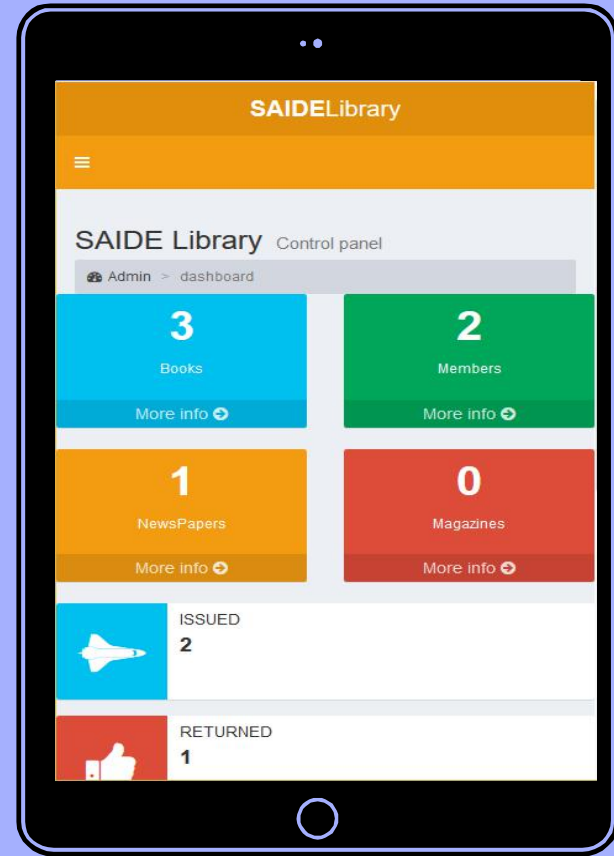

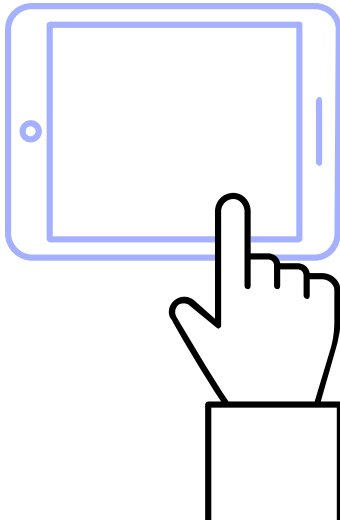

TABLE VIEW

Your table's view will have such a look.

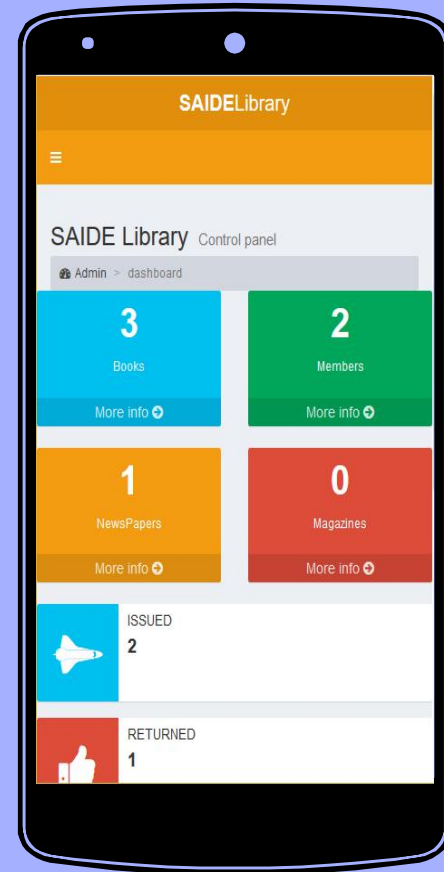

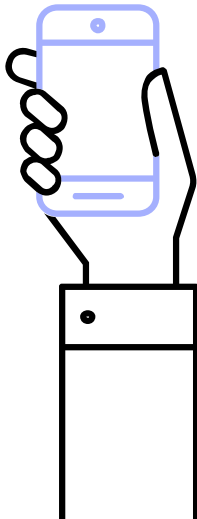

TABLET VIEW

Your project will have such a look on tablet devices

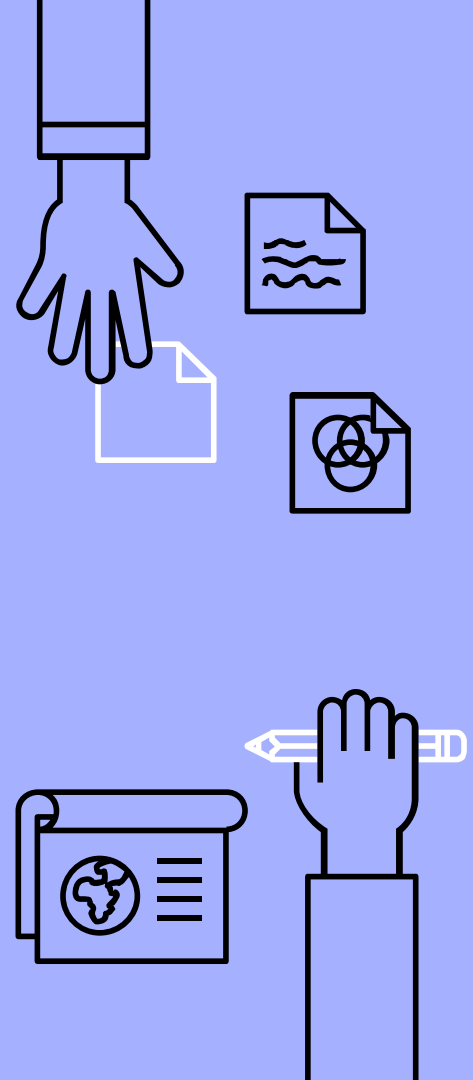

MOBILE VIEW

Your application will have such a look on mobile devices.

Before We Start....

- ▶ This documentation is for **Appgini Dashboard UI Kit**.
- ▶ Read all the instructions and illustrations provided herein carefully .
- ▶ They are clear and elaborate steps on how to use this boilerplate, follow them as they are.
- ▶ You can make your own modifications later on in the code if you have understood the basic structure to fit your needs.
- ▶ I am assuming that you already have basic html/css/php knowledge and have an existing appgini project you want to make changes to. If not dont worry...im here for you ,contact me at the end of this documentation.

In This Tutorial You Will Learn:

- ▶ *How to modify the look of your appgini project to have a professional admin dashboard UI using AdminLTE .*

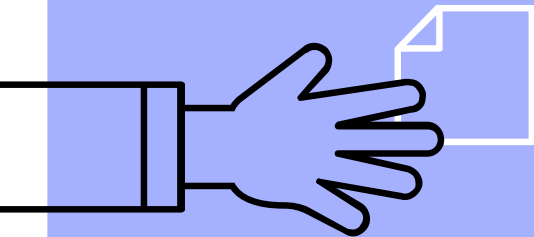

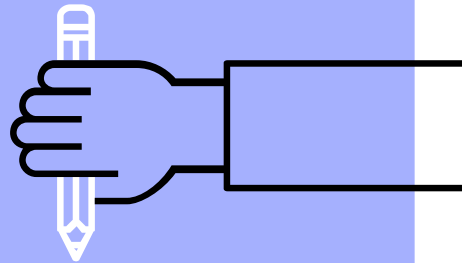

The AdminLTE version used is 2.4.3

You can update to the latest version available from their official website.

1. Copying adminlte folders

Let's start with the first task

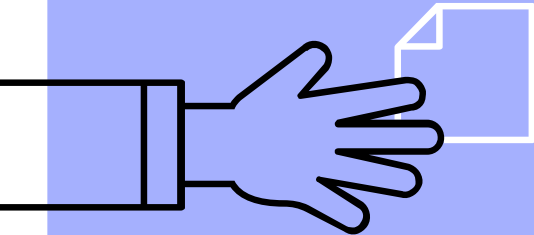

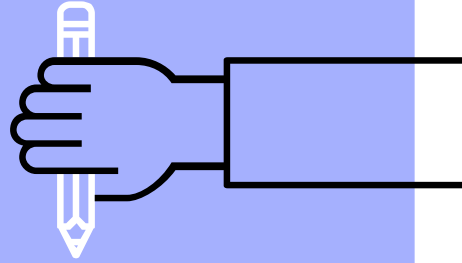

“

After downloading this boilerplate, extract it to a suitable location on your machine. Inside it, find the zipped folder named **adminlte.zip** and copy it to your **appgini** project folder and extract it there.

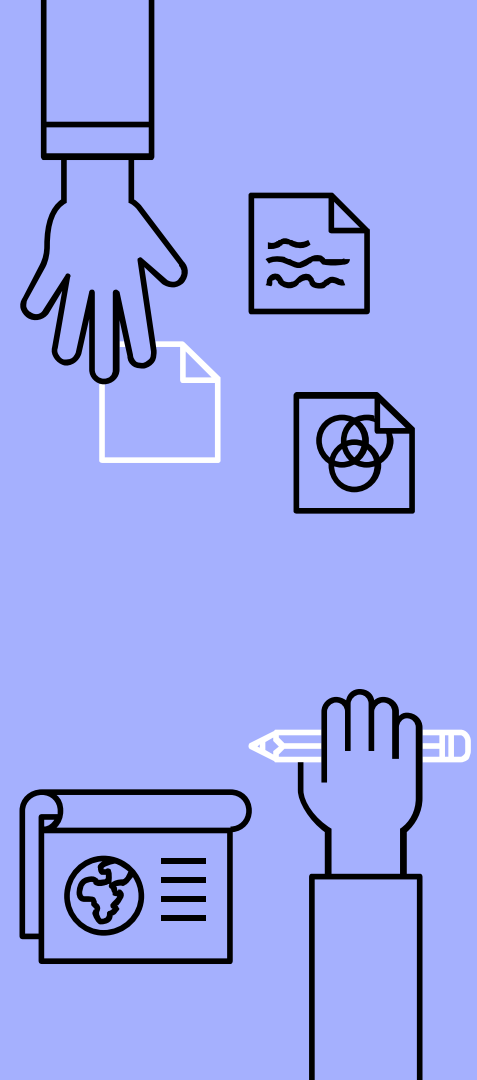

2. Copying custom files

second task

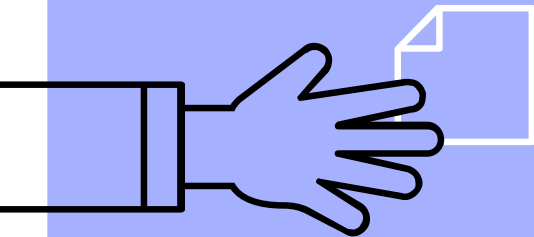

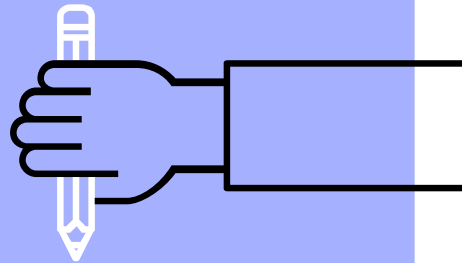

After completing the first task successfully, here is another simple task.

1. Find the files named **header.php**, **header-start.php** and **main.php** respectively. Copy these files to your appgini project folder. Realize **header.php** will **replace** the existing *header.php* in your appgini project folder.
2. After copying those files there is one more file remaining and that is the **footer-extras.php**. Copy it and place it in the **hooks** folder in your appgini project folder. It will replace the existing footer-extras.php

3. making some changes to appgini files

third task

- ❖ The **first** file we are going to edit is the **login.php** in your appgini project. Copy the following code and replace the code on the first five or so lines in the **login.php** file

```
<?php if(!isset($Translation)){ @header('Location: index.php?signIn=1'); exit; } ?>
```

```
<?php include_once("$currDir/header-start.php"); ?>
```

```
<?php if($_GET['loginFailed']){ ?>
```

```
<div class="alert alert-danger"><?php echo $Translation['login failed']; ?></div>
```

```
<?php } ?>
```

- ❖ Go to the last line of this file and delete this line of code

```
<?php include_once("$currDir/footer.php"); ?>
```

- NB: This will make our login page have a custom header that we created.

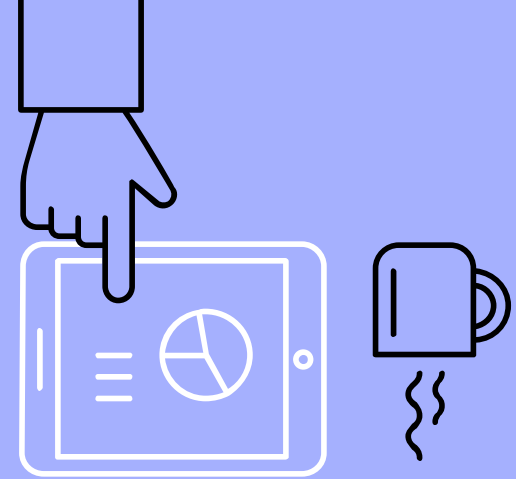

The **second** file we are going to edit is the **index.php**, in this one not so much changes are done.

Simply open the **index.php** file and go to the second last line with this line of code

include("{*\$currDir*}/home.php"); and **replace** it with the following line of code

include("{*\$currDir*}/main.php");

The **third** file we are going to edit is the **membership_signup.php**, in this also not much is going to be changed, go to line number **seven** or so with this code

```
include_once("{$currDir}/header.php");
```

 and simply **replace it** with the following line of code

```
include_once("{$currDir}/header-start.php");
```

Then go to the last line of this file and delete this line of code

```
<?php include_once("$currDir/footer.php"); ?>
```

NB: This one will make the signup page have the custom header that we created.

Once you are done with the above procedures you can save all the changes and run your project on your favourite browser. Your project will load...login with your credentials,and there you go to your new dashboard.

It looks fantastic!!

Now you will need to do some changes like:edit your project name,change the theme,add links to your tables on the side nav bar(header.php),edit the widgets in the main.php file.

You will realize your tables in the appgini project will be displayed..to hide them simply go to appgini and set hide link in home page,and you can also remove the groups since you will have to put the groups in the links on the side nav.

This will make your main interface less congested.

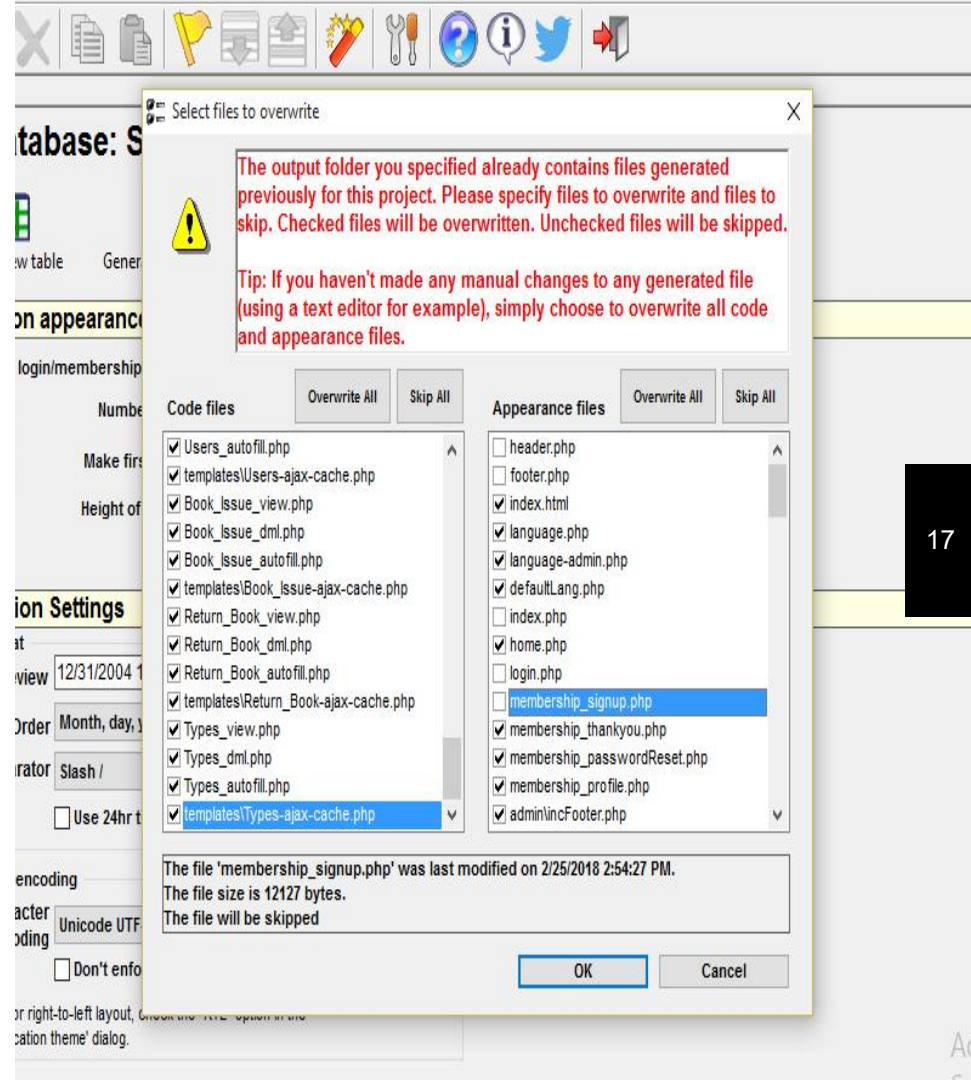

For more clarification send me an email or whatsapp me

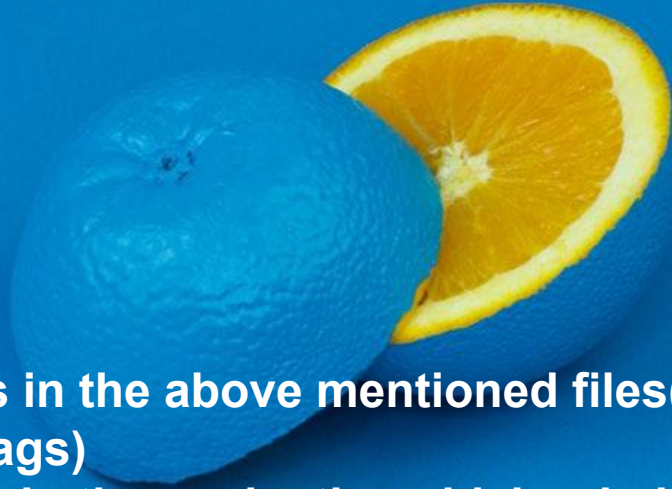

Files to take care of when regenerating your appgini project

- ☐ *index.php*
- ☐ *login.php*
- ☐ *membership_signup.php*
- ☐ *header.php*
- ☐ *home.php*

Note that when you overwrite these files when regenerating your appgini application the changes you made to them will be lost.

You can make changes to the `header.php`, `header-start.php` and `main.php` to fit the needs of your project

Changes include

- I. Changing the titles in the above mentioned files(put your project title in the `<title></title>` tags)**
- II. Changing the links in the navigation sidebar in `header.php` to fit your project**
- III. Adding and editing widgets in the `main.php` to fit your project needs**

THANKS!
